Band Score: 5.5

Original Essay

The line graph compare and predict the consumption of energy in USA using six different source from 1980 to 2030. It is clear that Petro and Oil is the most important fuel and keeps an upward trend overall.While Hydropower provide the lowest amount of energy consumption in most of time. In 1980, Pertol and Oil was the highest one, with the 35 quadrillion units.And rising to nearly 40 quadrillion units until 2008 which will be excepted to reach at 50 quadrillion units in 2030.The upward trend is also seen in Coal and Natural Gas, they are similar between 1980 and 2020, but the projections showing Natural Gas will be taken by Coal. The minority of fuel include Nuclear, Solar, Wind and Hydropower, remaining relatively stable, at between 3 and 8 quadrillion units during the whole 50-year period.Althought they are the same at 1980, Nuclear, Solar and Wind are showing a upward trend, and Hydropower instead.

Grammar & Spelling Check

Case 1

Original:

The line graph compare and predict the consumption of energy in USA using six different source from 1980 to 2030.

Corrected:

The line graph **compares** and **predicts** energy consumption in **the USA** using six different **sources** from 1980 to 2030.

Reason:

- **compare → compares**: subject-verb agreement.
- **predict → predicts**: verb consistency.
- **USA → the USA**: article required.
- **source → sources**: plural noun needed.
- **consumption of energy → energy consumption**: more natural academic phrasing.

Case 2

Original:

It is clear that Petro and Oil is the most important fuel and keeps an upward trend overall.

Corrected:

It is clear that **petrol and oil are** the most important **fuels** and **show** an overall upward trend.

Reason:

- **Petro → petrol**: spelling correction.
- **is → are**: plural subject.
- **fuel → fuels**: plural noun required.
- **keeps → show**: more formal academic expression.

Case 3

Original:

While Hydropower provide the lowest amount of energy consumption in most of time.

Corrected:

While hydropower **provides** the lowest amount of energy consumption for **most of the period**.

Reason:

- **provide → provides**: singular subject.
- **in most of time → for most of the period**: natural expression.

Case 4

Original:

In 1980, Pertol and Oil was the highest one, with the 35 quadrillion units.

Corrected:

In 1980, **petrol and oil were** the **largest energy source**, at **35 quadrillion units**.

Reason:

- **Pertol → petrol**: spelling correction.
- **was → were**: plural subject.
- **highest one → largest energy source**: more precise academic vocabulary.
- **with the 35 → at 35**: correct way to describe figures.

Case 5

Original:

And rising to nearly 40 quadrillion units until 2008 which will be excepted to reach at 50 quadrillion units in 2030.

Corrected:

The figure **rose** to nearly 40 quadrillion units in 2005 and **is expected** to reach about 48 quadrillion units by 2030.

Reason:

- Sentence fragment corrected.
- **rising → rose**: correct tense.
- **excepted → expected**: spelling and meaning correction.
- **reach at → reach**: incorrect preposition removed.

Case 6

Original:

The upward trend is also seen in Coal and Natural Gas, they are similar between 1980 and 2020, but the projections showing Natural Gas will be taken by Coal.

Corrected:

An upward trend can also be seen in **coal** and **natural gas** consumption. They remained at similar levels between 1980 and 2020, but coal is expected to **surpass** natural gas in the future.

Reason:

- Comma splice corrected by separating sentences.
- Capitalization corrected.
- **will be taken by → surpass**: more accurate academic wording.

Case 7

Original:

The minority of fuel include Nuclear, Solar, Wind and Hydropower, remaining relatively stable, at between 3 and 8 quadrillion units during the whole 50-year period.

Corrected:

The **minor fuel sources** include nuclear, solar/wind, and hydropower, which remained relatively stable at between 3 and 8 quadrillion units throughout the 50-year period.

Reason:

- **minority of fuel → minor fuel sources**: more natural phrasing.
- Capitalization corrected.
- Improved sentence structure.

Case 8

Original:

Althought they are the same at 1980, Nuclear, Solar and Wind are showing a upward trend, and Hydropower instead.

Corrected:

Although these sources were at similar levels in 1980, nuclear energy and solar/wind show **an** upward trend, whereas hydropower remains stable overall.

Reason:

- **Althought → Although**: spelling correction.
- **the same at 1980 → at similar levels in 1980**: more natural phrasing.
- **a upward → an upward**: article correction.
- Sentence rewritten for grammatical clarity.

Score Improvement Suggestions

Case 1

Original:

keeps an upward trend

Corrected:

shows / maintains an upward trend

Reason:

“Shows” and “maintains” are more formal and suitable for IELTS Task 1 writing.

Case 2

Original:

the highest one

Corrected:

the largest energy source

Reason:

More precise and academic vocabulary.

Case 3

Original:

the minority of fuel

Corrected:

minor fuel sources

Reason:

More natural and grammatically accurate expression.

Vocabulary Enhancement

Case 1

Original:

compare

Better Alternatives:

illustrate, **depict**, **show**, **present**

Case 2

Original:

important fuel

Better Alternatives:

major energy source, **dominant fuel source**

Case 3

Original:

upward trend

Better Alternatives:

steady increase, **gradual rise**

Corrected Essay

The line graph compares and predicts energy consumption in the USA using six different fuel sources from 1980 to 2030.

It is clear that petrol and oil are the most important fuels and show an overall upward trend, while hydropower provides the lowest amount of energy consumption for most of the period.

In 1980, petrol and oil were the largest energy source, at 35 quadrillion units, and the figure rose to nearly 40 quadrillion units in 2005. It is expected to reach about 48 quadrillion units by 2030. An upward trend can also be seen in coal and natural gas consumption. They remained at similar levels between 1980 and 2020, but coal is expected to surpass natural gas in the future.

The minor fuel sources include nuclear, solar/wind, and hydropower, which remained relatively stable at between 3 and 8 quadrillion units throughout the 50-year period. Although these sources were at similar levels in 1980, nuclear energy and solar/wind show a gradual increase, whereas hydropower remains stable overall.
