Original Essay

The flow diagram presents the manufacturing process of bamboo fabric like socks and clothes.

It is clear that there are nine steps to manufacture fabric from bamboo. The whole flow is complicated, including harvesting bamboo, processing bamboo, making yam, and producing fabric in the end.

At first, bamboo plants are planted in spring and can be harvested until autumn, which takes a long period of time. Then, the harvested bamboo will be cut into strips, and the strips then will be crushed to make liquid pulp. With the help of filter, the long fibres can be seprated from liquid.

After producing the raw materials of fabric, the long fibres are supposed to be softened by adding water and amine oxide. Sping the soft fibres can make yarn and then the yarn will be weaved to make fabric. In the final stage, the fabric products will be manufactured.

Grammar & Spelling Check

Case 1

Original: bamboo fabric like socks and clothes

Corrected: bamboo fabric **used for making** socks and clothes

Reason: “Fabric” itself is not socks or clothes; the phrase should show purpose more clearly.

Case 2

Original: making **yam**

Corrected: making **yarn**

Reason: Spelling mistake. “Yam” is a vegetable, while “yarn” is the correct textile term.

Case 3

Original: With the help of **filter**

Corrected: With the help of **a filter**

Reason: Missing article before the singular countable noun “filter”.

Case 4

Original: can be **seprated**

Corrected: can be **separated**

Reason: Spelling mistake.

Case 5

Original: **Sping** the soft fibres

Corrected: **Spinning** the soft fibres

Reason: Incorrect spelling and word form.

Case 6

Original: the yarn will be **weaved**

Corrected: the yarn will be **woven**

Reason: “Woven” is the correct past participle of “weave”.

Sentence-by-Sentence Review

Case 1

Original: The flow diagram presents the manufacturing process of bamboo fabric like socks and clothes.

Corrected: The flow diagram presents the manufacturing process of bamboo fabric **used for making** socks and clothes.

Reason: Improved clarity and grammatical accuracy.

Case 2

Original: It is clear that there are nine steps to manufacture fabric from bamboo.

Corrected: It is clear that there are nine steps **in the process of manufacturing** fabric from bamboo.

Reason: More natural and academic expression.

Case 3

Original: The whole flow is complicated, including harvesting bamboo, processing bamboo, making yam, and producing fabric in the end.

Corrected: The whole process is relatively complicated, including harvesting and processing bamboo, making **yarn**, and finally producing fabric.

Reason: Corrected spelling mistake and improved cohesion and academic style.

Case 4

Original: At first, bamboo plants are planted in spring and can be harvested until autumn, which takes a long period of time.

Corrected: First, bamboo plants are planted in spring and harvested in autumn, a process that takes a relatively long time.

Reason: Improved sentence conciseness and grammar.

Case 5

Original: Then, the harvested bamboo will be cut into strips, and the strips then will be crushed to make liquid pulp.

Corrected: Then, the harvested bamboo is cut into strips, which are subsequently crushed to produce liquid pulp.

Reason: Present simple tense is preferred in process diagrams, and the sentence is made more formal.

Case 6

Original: With the help of filter, the long fibres can be seprated from liquid.

Corrected: With the help of **a** filter, the long fibres can be **separated** from the liquid.

Reason: Added article and corrected spelling mistake.

Case 7

Original: After producing the raw materials of fabric, the long fibres are supposed to be softened by adding water and amine oxide.

Corrected: After the raw material is produced, the long fibres are softened by adding water and amine oxide.

Reason: “Are supposed to be” is unnatural here; passive voice is more suitable.

Case 8

Original: Sping the soft fibres can make yarn and then the yarn will be weaved to make fabric.

Corrected: Spinning the soft fibres produces yarn, which is then woven into fabric.

Reason: Corrected spelling and grammar while improving sentence flow.

Case 9

Original: In the final stage, the fabric products will be manufactured.

Corrected: In the final stage, fabric products such as clothing and socks are manufactured.

Reason: Added detail from the diagram and used more natural wording.

Score Improvement Suggestions

Case 1

Original: The whole flow is complicated

Corrected: The process involves several stages

Reason: More formal and academic wording for IELTS Task 1.

Case 2

Original: cut into strips

Corrected: sliced into narrow strips

Reason: More precise vocabulary.

Case 3

Original: make liquid pulp

Corrected: produce liquid pulp

Reason: “Produce” is more formal and suitable for process descriptions.

Case 4

Original: make fabric

Corrected: manufacture fabric

Reason: “Manufacture” is more academic and appropriate in this context.

Vocabulary Enhancement

Case 1

Original: presents

Corrected: illustrates, depicts, demonstrates

Case 2

Original: complicated

Corrected: complex, multi-stage

Case 3

Original: make

Corrected: produce, manufacture, create

Case 4

Original: cut

Corrected: slice, divide

Case 5

Original: process

Corrected: procedure, production process

Corrected Essay

The flow diagram illustrates the process of manufacturing bamboo fabric used for making clothing items such as socks and shirts.

It is clear that there are nine stages in the production of bamboo fabric, beginning with planting bamboo and ending with the manufacture of fabric products. Overall, the process involves harvesting and processing bamboo, producing yarn, and finally weaving fabric.

First, bamboo plants are grown in spring and harvested in autumn, which is a relatively lengthy process. After harvesting, the bamboo is cut into strips and then crushed to produce liquid pulp. Next, a filter is used to separate the long fibres from the liquid.

After the raw material has been prepared, the long fibres are softened by adding water and amine oxide. The softened fibres are then spun into yarn, which is subsequently woven into fabric. In the final stage, fabric products such as socks and clothing are manufactured.
