折线图 Line Chart

Percentage of households

The line graph presents the proportion of homes in the US that had certain types of equipment between 1995 and 1999.

Overall, **as the years went by**, the percentage of households that owned each kind of technology increased, with most homes possessing a washing machine.

As presented, the percentage of four of the five items rose throughout the given period. Sixty percent of the surveyed households had a washing machine in 1995, and this increased steadily until 80% of all homes had at least one of these **appliances** in 1999. The next three types of technology, namely the phone (75%), computer (70%), and internet (50%), also became more **prevalent** in American households by 1999, with the phone having **the highest percentage jump as** less than 20% of homes had a phone in 1995.

Although many homes in the US also came to own a DVD player, **the trend for owning one was not always positive**. In 1995, roughly 25% of American homes had this **gadget**, but this dropped to just 15% one year later. Nonetheless, more and more households began purchasing DVD players until 40% of them had this **device** in 1999

production(millions) of the products

The line graph displays the production changes of three **clothing items** made in **a garment factory** between 1990 and 2010.

Overall, the production of all three **clothing apparel** generally grew over the years. Coat production was the only one that did not **suffer a decline**; it was also **the most produced clothing item**.

Among the three products, it was only **coat production** that steadily grew **during the given two decades**. In 1990, around 7 million coats were produced, and **this figure more than doubled to roughly 18 million coats** ten years later. By 2010, the factory **had manufactured** 25 million coats. The suit was the next most in-demand garment produced. At the start of the period, 15 million suits **were created**, the highest for the year. Suit production increased sharply over the next five years, **reaching its peak of 23 million**. But then **production declined**, falling to around 16 million in 2005. At the end of the period, the factory made approximately 19 million suits for interested buyers.

The least-produced garment was the dress. Though dress production generally increased, it did not reach the same levels as the other two clothing items. In 1990, 10 million dresses were sewn, and by 2010, dress production levels had reached 15 million.

柱状图 Bar Chart

Percentage of types of waste that were recycled in a town

The bar graph illustrates the percentages of four waste materials that a town recycled in 2000, 2005, and 2010.

Overall, the town's effort to recycle the selected materials **greatly improved over the years**, **with metal objects and cans being the two waste products mostly recycled at the end of the period**.

As presented, in the year 2000, **the recycling efforts of the town were minimal** for all four waste materials, as **less than 15% of each type was recycled**. But after five years, the town's efforts improved in three categories. The most noticeable improvement was the recycling of metal products, **jumping from roughly**

12% in 2000 to nearly 30% in 2005. **Next came paper (around 18%) and plastic waste (about 12%)**. However, the recycling efforts for cans droped to just 11% in 2005.

Nonetheless, in 2010, the town made great strides environmentally as the percentage of recycled materials improved **tremendously**. The recycling of metal **still led the way at 40%**, but the biggest change was in the recycling of cans at approximately 35%, a twofold increase. The recycling percentages of paper (nearly 28%) and plastic obiects (rouahly 25%) also went up.

Spending on health among three different countries between 1990 to 2010

The bar graph displays the health spending of three nations from 1990 to 2010.

Overall, spending for healthcare for all three countries generally rose over the given two decades, with Japan spending the most throughout.

During the given period, Japan **consistently** spent the most on healthcare, with expenditures generally increasing every five years. In 1990, healthcare spending was $8 billion, and by 2000, spending had risen to $13 billion. Though there was a slight dip to just $12 billion in 2005, Japan's expenditure in 2010 ended at $14 billion, **nearly 50% higher than the other two countries**.

Italy generally had the second highest spending on health, though not as high as Japan. At the start of the period, Italy's spending was around $3.5 billion, **barely half that of Japan**, but this **more than doubled to $8 billion** five years later. After dropping to $6 billion in 2000, Italy's healthcare spending grew until it hit $10 billion in 2010.

France had a very different approach to health expenditure. For 15 years, France's spending was generally fixed at just $2 billion, except in 1995 when it disbursed around $3.5 billion for health. Surprisingly, in 2010, **France's healthcare spending increased to $10 billion, five times its expenditure in 2005.**

Average life expectancy in different countries in six countries

The bar graph presents the data of selected countries on their average life expectancy.

Overall, it seems that, on average, citizens in wealthier nations live longer than people in developing countries.

As presented, the two wealthiest nations on the list have much higher life spans than the rest. **Citizens of Monaco may live until they are around 85 years old**, while those in the United States, on average, may **reach the age of 80**.

Among the developing countries, the people in the Philippines live the longest, with citizens possibly living until they are 70 years old. Though **this figure is quite high compared to the rest**, it **is aroung 15 years less than nationals of the richer countries**. In contrast, the average life expectancies in the remaining three developing nations do not breach the 60-year-old mark. People in Laos and Rwanda live until they are roughly 58 and 55 years old, respectively. However, those living in Kenya are only expected to remain on the earth until they are 50, a far cry from citizens coming from the more affluent countries.

Average class size in primary schools and lower secondary schools in six countries compared to the world average in 2006

The graph presents the standard class size of primary and lower secondary schools in 6 selected nations in 2006, **comparing them against the global average.**

Overall, among the given countries, the two Asian nations, South Korea and Japan, had average class sizes that were higher than the world average. Iceland, however, had the lowest figures for both types of school.

In 2006, the average class size around the world was approximately 26 pupils for primary school and 24 pupils for lower secondary school. For primary school, four of the selected countries had an average class size that was less than the world average, namely the UK (22), Denmark (21), Mexico (21), and Iceland (15). South Korea, however, had 8 more students per teacher than the world average, while Japan had one extra.

For lower secondary schools, the selected European nations still had smaller class sizes compared to the global average. Iceland had the smallest among them, with around 16 students per teacher, whereas Denmark and the UK had 18 and 22 students, respectively. For the remaining nations, South Korea had an average of 34 students in a class, 50% more than the world average. Mexico had 32, and Japan had 31.

饼状图 Pie Chart

Percentage of five types of food sold by a supermarket

The pie graphs present the percentage of **food products in a particular supermarket that were sold** in 2003 and 2013.

Overall, buyers tended to purchase protein products more than fruits and vegetables. Meat was **the favored protein** at the end of the period, while shoppers preferred vegetables more than fruits.

In 2003, the supermarket sold more protein products (60%) than fruits and vegetables, which was a combined 40%. The buyer preference between the three protein options was not that far, differing only by a percentage point each, with meat (21%) leading the way, **followed by eggs (20%) and seafood (19%)**. As a product category, vegetables, however, did **have the highest percentage** among the five classes of food sold **at 25%**, while fruits **had the lowest percentage of sales at just 15%**.

A decade later, overall percentages of protein and plant products sold remained the same at 60% and 40%, respectively, yet there were slight changes in each food category. Meat (25%) was still the preferred protein option, but it was also the most purchased type of food in 2013. Seafood, however, was now the second favored protein product, while **only 14% of the items sold in the supermarket were eggs**. Despite a slight drop in percentage, **shoppers still bought more vegetables (23%) than fruits (17%)**.

ptoduction of tea, consumption of tea, where the prodit goes

The three pie graphs display global tea production and consumption as well as **the distribution of profits from the tea industry**.

Overall, south Africa Is the biggest tea proacer worldwide, whereas Europe is where tea is primarily consumed. Regarding profit distribution, much of the earnings go to the transport of tea products rather than the producers themselves.

As presented, South Africa is the biggest tea producer, contributing nearly 40% of global tea products. **The remaining supply** comes from Asia, **with Indonesia (25%) as the next biggest supplier**, **followed by Japan and Vietnam**, **which are nearly equal** in tea production.

Tea consumption presents a different story as tea is predominantly consumed in regions outside where it is produced, except for Japan. European nations consume half of the tea worldwide, followed by the USA, where more than a quarter of the tea supply is consumed. Japan, one of the global suppliers, is at roughly 5%, while other countries drink the rest.

Regarding profits, surprisingly, **most of the earnings go to the delivery of tea products (50%)**. Retailers take up the next biggest chunk, **receiving 25% of the profits**. Exporters and tea producers only gain around 10% each for their efforts, while the remaining profits go to other parties involved in the tea business

Revenue sources and Expendituresof a children's charity

The given charts present the revenue and expenses for a year of a children's charitable foundation in the United States. **The first chart** depicts the charity's sources of income, and **the second chart** details where the money was spent.

Overall, the children's foundation received more than it spent. **Food donation was the primary source of revenue**, while **the largest expenditure was for its program services**.

In terms of revenue, the charity **received $53,562,580** for the year. The majority of this was food donation, which accounts for 86.6%. For the money received, the biggest contribution came from the local community, which was 10.4%, **nearly five times that of the money earned by the charity's programs**. **The remaining income came from other sources (0.4%), investments (0.2%), and government assistance (0.2%)**.

As for expenditure, the charity **spent $53,224,896**, leaving a surplus of $337,684. Most of the money was utilized for the program services, accounting for 95.8% of the earnings received. **The remaining disbursements were for fundraising costs (2.6%)** and management and general purposes (1.6%).

four kinds of vehicles used in the UK in 1965, 1985 and 2005

The three charts illustrate the percentage of four different kinds of vehicles used throughout the UK in 1965, 1985 and 2005.

Generally, the majority of transportation options, including public transport, lorries, and other commercial vehicles, and recreational vehicles, **experienced decline once over the periods**. In contrast, the popularity of driving private car increased **notably and continually**.

From 1965 to 1985, the use of public transport **fell slightly from 25% to 20%**. Additionally, recreational vehicle use **saw a significant decline and fell by over half, where it went from 15% to 5%**. In contrast, the utilisation of lorries and other commercial vehicles **remained stable**, however the use of private cars **saw remarkable growth, increasing from 40% up to 55%**.

In 2005, some transport modes recovered from their previous declines in 1985, recreational vehicles **grew marginally, moving from 5% to 8%**. Meanwhile, public transport usage **grew by just 2%**. Moreover, **the use of private cars continued to increase**, although not as **immensely** as in the previous 20 years. Conversely, lorries and other commercial vehicles declined dramatically from 20% in 1985 to just 10% in 2005.

表格 Table

Number of passengers of seven different airlines

The table displays data on the number of passengers that rode the top seven US airlines between 1995 and 2005.

All seven airlines experienced substantial growth, with JetBlue having the highest growth rate. Delta Air Lines, however, had the most passengers overall in the given period

Among the given airlines, one **saw its numbers triple**, while **the figures of four other airlines more than doubled**. JetBlue Airways **experienced the highest growth rate of 249%**. In 1995, **86,000 people rode JetBlue, tripling to 300,000 in 2005**. Hawaiian Airlines, American Airlines, and Alaska Airlines came next in growth rate percentages with 150%, 127%, and 114%, respectively. Despite their high rates, their figures were all under 350,000 in 2005. Even though Delta Air Lines only had a 113% growth rate, it consistently had the most passengers in both years: 500,700 in 1995 and 1.064 million in 2005.

The growth rates of Southwest Airlines and United Airlines were not as high as the other companies, but they did transport many people in the given years. **Four hundred thousand travelers** took Southwest Airlines in 1995, growing to 640,000 a decade later, an improvement of 66%. Although United Airlines' growth rate was

the lowest at 33%, its 400,000 travelers in 2005 were still much higher than the other airlines **with growth rates above 113%**.

Number of people taking part in a national health survey

The table presents the number of women and men from 2005 to 2009 that answered a national health survey about their sleeping habits.

Overall, it is clear that as the years went by, more and more people took part in the health survey about sleep. However, there seems to be no clear trend for the gender distribution of participants.

In 2005, only 8000 people participated in the national health survey about sleeping habits. **Three-fourths** of the respondents were women, while only 2000 were men. A year later, **the figures grew sixfold as 48,000 people answered the survey**. But this time the majority of the participants were men (36,000), while only 12,000 women got involved. However, the following year, **the distribution of men and women was equal**, as **32,000 of each gender** answered the questions.

The final two years showed a tremendous increase as the overall figures reached at 362,000 and 540,000 respondents in 2008 and 2009, **respectively**. In 2008, of the 362,000 people that answered the national health survey, roughly 331,000 participants were women, while just 9% were men. But in 2009, when the numbers grew to more than half a million, the figures for both men and women were the same at 270,000 respondents each.

Employment of university graduates in the U.S.

The table presents data on the 2005 employment rates of university graduates of selected cities in the USA.

Overall, **more than half of all university graduates** in the given cities **found employment**, **with the highest rate being** graduates from New York. Nearly all the graduates had permanent jobs, except graduates from Chicago, and very few **opted to** work overseas.

University graduates from New York **had the highest employment rate at 66%**. The majority of them were **permanently employed** (55%), **while the rest had temporary jobs (8.70%) or worked overseas (2.30%)**. **Close behind, graduates from Chicago's universities had the second highest rate at 62.80%.** Unlike New York, however, most of Chicago's graduates were temporarily employed (36.30%), and just 24.20% had permanent positions. Similar to New York, only 2.30% worked outside the US.

The employment rate for graduates from two of California's biggest cities, Los Angeles and San Francisco, had the same rate of 53%. The graduates from Los Angeles were mainly employed permanently (45.80%), whereas 5% opted to work abroad, the highest among graduates of the four cities. Just 2.20% of graduates from Los Angeles had temporary jobs. Lastly, San Francisco's university graduates also opted for permanent work (34.40%), while nearly half found themselves in temporary positions (16.10%). Few of San Francisco's graduates sought opportunities in other countries (2.50%).

Number of international students in Canada and USA in 2002 and 2003

The tables present the number of students from other countries who studied in Canada and the USA in 2002 and 2003 as well as **the increase by percentage (增长百分比)** in these two years.

The total number of international students in the USA was three times as high as that of international students in Canada in 2002 and 2003. Most international students studied in the USA and Canada came from China and India.

In the first table, among the three countries, the largest group of students in Canada came from China with 3100 students in 2002, followed by 2243 American students. India only had about 1600 students in that year.

In 2003, the number of Chinese students rised to almost 4000 and that of Indian students increased by 50%. In contrast, there was a slight decrease in the number of American students.

In the second table, the number of Indian students studied in the USA largely exceeded that of the students from the other two countries. Besides, there were more Indian students going to university in America in 2003, increasing by 29%. The number of Chinese students was 5650 in 2002 and **the number climbed to 7545 a year later, increased by 33%**. By contrast, there were fewer Canadian students, decreasing from 6852 to 5214.

Salaries of people among five industries

The chart **shows the maximum, minimum and average salaries of people** employed in five different industries in 2009.

The finance industry offered higher salary than any other field of employment, regardless of an employee's position on the pay scale.

Among the five employment areas in the table, **employees in the finance industry had the highest maximum earnings at £8850** whereas at the other end of the scale, the best paid hospitality workers received around a third of this amount, **with a maximum salary of just £2900**. **The highest minimum salaries were also found in the finance sector**, with even the lowest paid employees making £1600. By contrast, **construction workers earned the lowest minimum at just £790**, which was less than half the minimum wage in the finance industry.

The average salary of £5225 in the finance sector, was significantly higher than in any of the other industries, and **nearly doubled the second highest average salary of £2712 found in the transportation industry**. Workers in construction and hospitality had the lowest average salaries, earning £1945 and £1895 respectively.

混合图 Mix

cinema visits: Average number of all ages & Average number of different age groups

The table and line graph present data on cinema visits between the years 1995 and 2003 in Auckland.

Despite a slight rise in the percentage of people going to the cinema, the annual average visits did not necessarily go up. **Among the age categories, the younger the group, the more frequently they went to the movies.**

In 1995, 67% of the population went to the cinema. But this rose to 72% in 1997 and remained the same in 1999. 2001 had the highest percentage of moviegoers at 80%, yet this declined to just 72% in 2003.

Regarding the frequency of visits of all age groups, the average generally fell from 10.3 visits in 1995 to just 8.3 in 2003. **The youngsters (ages 14-24) visited the cinema the most**, **beginning at 10.5 visits in 1995 and ending at 10.0 visits in 2003**, higher than **the overall average**. **Young adults (ages 25-34)** and **middle-aged adults (ages 35-49)** came next with nearly identical moviegoing patterns. In 2003, the average number of visits of young adults was 10.0, while middle-aged adults watched movies around 9.5 times a year. **The older adults (ages 50+)** did not frequent the cinemas as much, **bringing down(拉低) the overall average**. In 1995, older adults visited the cinema roughly 9.3 times a year; this was around 9.1 in 2003.

Tourist from three countries & two way to spend holiday

The bar graph displays data on New Zealand's tourists from three countries in 1999 and 2009. The line graph presents information about two activities tourists did while on vacation.

Overall, **New Zealand experienced a rise in tourists from the UK and the US**, whereas numbers from Japan dropped. Tourists generally preferred to stay in New Zealand's resorts, although **backpacking had become just as popular at the end of the period**.

Tourists to New Zealand from the UK and US both increased by 2009. In 1999, a million visitors were from the UK, while 800,000 came from the US. A decade later, **the figures for both countries jumped**: 1,600,000 for the UK and roughly 1,500,000 for the US. Japanese visitors, however, decreased in the same period. From a high of 1,500,000 in 1999, Japanese visitors to New Zealand fell to around 1,100,000 in 2009.

As for how tourists enjoyed their New Zealand vacation between 1999 and 2009, most preferred to stay at a resort. In 1999, around 1,700,000 visitors were checked in. **Figures rose to about 2,400,000 in 2004 before falling to just 1,100,000 in 2009.** On the other hand, backpacking became a trend, as approximately 250,000 tourists backpacked in 1999. The numbers increased nearly fourfold until 1,100,000 backpacked in New Zealand in 2009, similar to those staying in resorts.

Average temperature in 12 months & annual hours of sunshine

The line chart presents the average monthly temperatures in three different cities over the period of a year.

In New York, **the temperature in January is below 5 degrees, slightly lower than that in London**. In mid-March **it exceeds London's record** and then **climbs up to nearly 30 degrees in June**. After **remaining 5 degrees higher than that in London** from June to September, New York starts to become colder from October onwards. The decrease eventually goes below 10 degrees in December while London remains around 10 degrees.

The fluctuation of temperatures in Sydney is opposite to the other two cities. **January is the warmest month at 30 degrees** but a downward trend occurs in the following 5 months, with the temperature drastically dropping by up to 50% before bouncing back to 26 degrees at the end of the period.

New York has the highest record of sunshine exposure (2633 hours) whereas the amount of sunshine London receives is far less than that of the other two cities. Totally, the records of the highest temperature in Sydney and New York are quite similar.

Percentage of world population & over 65 years old from 1950 with projections till 2040

The line chart presents the percentage of world population under 5 years old and over 65 years old from 1950 **with projections till 2040** while the table shows the changes in the proportions of population aged over 65 years old in six regions in 2030 and 2040.

Overall, the trend of expansion in aging population worldwide will be inevitable, with **western Europe and Latin America contributing more to the growth** in 2040.

According to the line chart, the percentage of the young population **showed a downward trend from 30% in 1950 falling to around 12% in 2010**. Afterwards, **it is projected to remain steady till 2040**. By contrast, the older population **kept rising from 5% in 1950 to 15% in 2010**. From 2030 onwards, it is likely that there will be more than 15 percent of citizens worldwide aged over 65, which is higher than the figure for the ones who are under 5.

According to the table, in 2030 western Europe will possibly **have the highest percentage of aging population with 22%**, followed by Asia with 18%. The gap between Latin America and North America will be widened two decades later. In 2040, **western Europe will remain the top one with 26%**. Latin America may witness a rapid increase by 10%, overtaking Asia by 5%. Sub-Sahara can be the only region that will experience a population decrease in size for the elderly.

Number of university students & government spending on per student & students' financial condition

The first chart gives information about **the number of students that enrolled in university** in a country **over the period of 25 years**. In 1984, there were around 160000 university students, but the number increased to 400000 students in 2009 which was more than twice as high as the record in 1984.

The second chart shows the amount of government funding that each student received. Clearly we can see a downward trend, falling from 14500 dollars to 11000 dollars in 2004. **Although there had been a slight increase by 2009, the amount of spending was still much lower than that in 1984**.

The last chart illustrates three levels of family income of these students. Over half of the students come from middle income families, **followed by low income families with 26%**. However, the ones that are better off only **consist of less than 20%**.

To sum up, it might be possible that the financial situation of most students' families is above the average level, so **even if the governmental funds were reduced, the number of university students still continually increased** from 1999 to 2004.

流程图 Flow Chart

the production of canned fruits

The flow chart present **how canned fruits are produced**.

Overall, the canned fruit process **undergoes fourteen steps**, from picking the fruits to the canning process itself, until the fruit jars are ready to be sold at the supermarket.

The first step is to harvest the fruits from the trees. Once gathered, the fruits are transported to the factory where only the best fruits are selected and weighed to ensure they are suitable for canning. The selected fruits are then washed and kept in a refrigerator until the next part of the canning process begins.

To create the jars of preserved fruits, the fruits are removed from the storage, peeled, and sliced. The fruit slices are then placed in a jar containing either water, juice, or syrup, depending on the fruit and the objective of the manufacturer. Once the jar is full, it is sealed and then cooked to sterilize the contents so that it lasts longer and no one gets sick when eating the finished product.

After sterilization, the jar is allowed to cool down before it is packed together with other jars. These are all then transported to the supermarket to be purchased and consumed.

地图/对比图 Map

A map

The **diagram** presents a factory's layout for its buildings and housing for the staff.

Overall, the proposed setup ensures the factory buildings are strategically spaced so that work can go on unhindered and that the organization's personnel and families are nearby, yet far from the noise and busyness of the factory complex.

As seen, the main industrial areas will **be located at the center** and **the southeast corner of the land**, possibly to minimize travel between buildings. The central hub will contain an enclosed area for factory buildings, which may be the key factories, as well as the main office and meeting area. The remaining industrial buildings will be in an isolated patch **in the southeast**, far from the residential areas. A large parking area will **be built to the northwest of the area**, possibly to prevent congestion in the places of work. **Access to the factory buildings will be via the roundabout**, although the entryway to the central facilities will only be through the east road.

Furthermore, **nearly three-fourths of the area will contain residential areas for staff**, ensuring workers can easily get home. **There will be a large swimming pool in the northeastern portion of the land for recreation**.

A popular tourist destination in a city in 2000 and 2010

The **illustrations** present a city's popular tourist spot in the years 2000 and 2010.

Overall, the heritage railway tourist spot **was greatly improved to offer visitors more options** and ensure people were more secure.

In 2000, the heritage railway featured a wide, open area where visitors could see a historical railway and a scenic view of the river that flowed by. Despite being a popular destination, tourist amenities were minimal. There was only an outdoor toilet for visitors and just one gift shop for souvenirs and possible refreshments.

A decade later, there were many more attractions to make the area more enticing and safer for the public. The heritage railway was the same, but there was now a hotel to cater to tourists who wished to spend the night and a parking area for visitors. **There was also a cafe for refreshments, open to guests of the hotel or just sightseeing for the day.** Instead of a gift shop, there was a sculpture, possibly commemorating the history of the area. And there was a guardrail along the river bank to ensure visitors' safety when viewing, walking or taking pictures by the river.
